

# Noise barrier at Tican Industries

Sustainability and good adaption to the local environment were important factors for the Tican Industries when a reduction of the spread of noise were required due to a substantially increase of the company activities.

Tican Industries chose Miljøskærm's sustainable solution for a 400 m<sup>2</sup> absorbing noise barrier substantially reducing the noise from the activities for the citizens in the neighboring urban area.

*Typical damping effect of Miljøskærm noise barrier element*

*Noise absorbing side facing Tican Industries*

The elements in the 3,5 meter high noise barrier contain acoustic absorbent material from recycled wind turbine blades in frames of galvanized steel.

On the side facing the local community the barrier is clad with vertical planks of lark.

Green plants growing up along the vertical planks give the barrier an attractive organic impression.

*from wind turbine to noise barrier*
